i-tec Remote management Software for docking station C31SMARTDOCKPD

Description

This software tool allows full management of docking stations with product code **C31SMARTDOCKPD**.

The main features of the software tool include:

DASHBOARD
An overview dashboard, showing in particular:

- basic data about the docking stations (number of stations in use and their utilization rate)
- real-time monitoring
- historical statistics on docking station usage (and resources)

INFORMATION ON DOCKING STATIONS
Detailed information about each docking station, including the possibility to control them. This tool displays all docking stations (filterable by company, department, office location, etc.) and allows the administrator to:

- Turn the docking station on and off remotely (in case of remote shutdown, the user is not able to turn it on by himself)
- Overview of the docking station status (OK; Partial Error; Error), with the possibility of remote reboot
- Switching on and off of the individual components of the docking station (USB ports, video ports, LAN, audio); if they are switched off, they cannot be used by the user
- Overview of the docking stations' connection to the corporate network (WiFi and Bluetooth Mesh)

FIRMWARE UPGRADE
With this tool, the administrator has a perfect overview of the current status of the docking stations in terms of firmware updates. If necessary, the firmware can also be upgraded, for one or more docking stations at a time. The tool allows:

- Schedule the update as needed (selecting the docking stations, selecting the desired firmware, selecting the day and time when the update should be performed)
- If necessary, rollback (installing older firmware)

FLOOR MAP

A tool that clearly displays the docking stations in each office, including a graphical display of which docking stations are in use and which are not.

It can be used, for example, as a separate display module in Open Office offices, by which users of these offices can easily find a free desk (or a desk with a docking station that is not connected to a computer)

SETTINGS

In this tool, the administrator can set basic application and environment parameters:

- Add/Remove Department
- Add/Remove Office
- Upload firmware
- Set access for individual users
- Set up notification functionality (who, how and when to send email notifications)

INFORMATION: To use the software, you must have a number of licenses equal to the number of docking stations that will be remotely managed (licenses can be purchased on an ongoing basis)
